Definition

Given a set S, a *numbered partition* of S (or *labeled partition*) is a numbering of some partition of a S. In other words, a numbered partition $(\pi_1, \ldots, \pi_p)$ of S is such that

$$\{\pi_1, \ldots, \pi_p\} \quad \text{partitions} \quad S$$

As before, π_i is called a *part* of the partition, for $i = 1, \ldots, n$. In this case p is the *size* and $(|\pi_1|, \ldots, |\pi_p|)$ is the *shape* of the numbered partition.

When we speak simultaneously of partitions (as defined in Partitions) and numbered partitions, we sometimes call a *partition* an *unnumbered partition* (or *unlabeled partition*, *allocation*). In this case, the *size* of a partition P of S is the multiset $m : \mathbf{N} \to \mathbf{N}$ defined so that $m(k)$ is the number of parts of size k in P.
