Why

We want to talk about the size of a displacement.[1]

Definition

The *norm* of a vector $x \in \mathbf{R}^2$ is

$$\sqrt{x_1^2 + x_2^2}.$$

Notation

We denote the norm of x by $\|x\|$. In other words, $\|\cdot\| : \mathbf{R}^2 \to \mathbf{R}$ is a function from vectors in $\mathbf{R}^2$ to real numbers. The notation follows the notation of absolute value, the *magnitude* of a real number, and the double verticals remind us that x is a vector. A warning: some authors write $|x|$ for the norm of x when it is understood that $x \in \mathbf{R}^2$.

[1] Future editions will complete.
