

Why

We want a notation for expressing the sum of a sequence of real numbers.

Definition

Let $x = (x_1, \dots, x_n)$ be a sequence of real numbers. The *sequence sum* of x is the result of first summing the first two numbers, then summing the result with the third number, and so on, until we have summed all the numbers.

Notation

Let $x = (x_1, \dots, x_n)$ be a sequence of real numbers. We denote the sequence sum of x by

$$\sum_{i=1}^n x_i$$

Summing over finite sets

Suppose A is a finite set and $f : A \rightarrow \mathbf{R}$ is a function. Then we the notation

$$\sum_{a \in A} f(a)$$

is notation for $\sum_{i=1}^n f(\sigma(i))$ where $\sigma : \{1, \dots, |A|\} \rightarrow A$ is any numbering of A . The numbering is inconsequential because addition is commutative.
