

## Why

Often we care about multiple criteria at once.<sup>1</sup>

## Definition

A *multiobjective optimization problem* is a pair  $(X, f : X \rightarrow \mathbf{R}^d)$ . As before,  $X$  is the *constraint set* and  $f$  is called the *objective function*. Since  $f$  is vector valued, and there is no natural order on  $\mathbf{R}^d$ , there may exist  $x \in X$  with non-comparable images under  $f$ .

## Scalarization

The  $\alpha \in \mathbf{R}^d$  *scalarization* of a multiobjective optimization problem  $(X, f)$  is the optimization problem  $(X, g)$  where  $g : X \rightarrow \mathbf{R}$  is defined by  $g(x) = \alpha^\top f(x)$ . We call  $g$  the *scalarized objective*.
