

SENTENCES

Why

We want to talk about objects and sets of objects.

Symbols and Words

On this page are the Latin letters forming words of the English language. The letters of the English language are a, b, c, d, e, f, g, h, i, j, k, l, m, n, o, p, q, r, s, t, u, v, w, x, y, z. A word is several letters next to each other. The words are many, and listing them is no task for this sheet. An example will suffice. The word "example" consists of the letters e, x, a, m, p, l, e.

It is an old truth that the words are visual marks corresponding to sounds, and that the sounds themselves are auditory marks corresponding to thoughts. It is an old debate whether thought needs language, but that will not concern us. If x is an object. $\in \varepsilon$

Discussion

An *assertion* is a sequence of symbols which is assumed to be true.

Let a be an object. Let A be a set. A *membership assertion* is $a \in A$. Notice that \in is not symmetric. $a \in A$ does not assert the same meaning as $A \in a$.

Let b be an object. An *identity assertion* is $a = b$. Notice that $a = b$ asserts the same as $b = a$.

A *primitive sentence* is a belonging assertion or an equality assertion. The symbolism used includes three pieces: the names of the two objects and the symbols \in or $=$.

A *logical form* is one of several structures:

1. and
2. or (in the sense of “— or — or both”)
3. not
4. implies (in the sense of “if —, then —”)
5. if and only if
6. for some
7. for all

This list is redundant.
