

### **Why**

We extend modular arithmetic to the real numbers.

### **Definition**

Two real numbers  $x, y \in \mathbf{R}$  are congruent modulo  $\alpha \in \mathbf{R}$  if their difference is a multiple of  $\alpha$

### **Notation**

For  $x, y \in \mathbf{R}$ , if  $x$  and  $y$  are congruent modulo  $\alpha \in \mathbf{R}$  we write

$$x \equiv y(\mod \alpha)$$
