

# Sets

## 1 Why

We want to talk about none, one, or several things considered as a whole, for which we will use the word *set*.

## 2 Definition

A **set** is an abstract object which we think of as several objects considered at once. We say that the set **contains** the objects so considered. We call these the **elements** of the set.

We call the set which contains no objects the **empty set**. We call a set which contains only a single object a **singleton**. A singleton is not the same as the object it contains. Besides these two cases, we think of sets as containing two or more objects.

## 3 Examples

For familiar examples, let us start with some tangible objects. Find, or call to mind, a deck of playing cards.

First, consider the set of all the cards. This set contains fifty-

two elements. Second, consider the set of cards whose suit is hearts. This set contains thirteen elements: the ace, two, three, four, five, six, seven, eight, nine, ten, jack, queen, and king of hearts. Third, consider the set of twos. This set contains four elements: the two of clubs, spades, hearts, and diamonds.

We can imagine many more sets of cards. If we are holding a deck, each of these can be made tangible: we can touch the elements of the set. But the set itself is always abstract: we can not touch it. It is the idea of the group as distinct from any individual member.

Moreover, the elements of a set need not be tangible. First, consider the set consisting of the suits of the playing card: hearts, diamonds, spades, and clubs. This set has four elements. Each element is a suit. Second, consider the set consisting of the card types. This set has thirteen elements: ace, two, three, four, five, six, seven, eight, nine, ten, jack, queen, king. The subtlety here is that this set is different than the set of hearts, namely those thirteen cards which are hearts. However these sets are similar: they both have thirteen elements, and there is a natural correspondence between their elements.

Of course, sets need have nothing to do with playing cards. For example, consider the set of seasons: autumn, winter, spring, and summer. This set has four elements. For another example, consider the set of Latin letters: a, b, c,  $\dots$ , x, y, z. This set has twenty-six elements.

### 3.1 Notation

To aid in discussing and denoting objects, let us tend to give them short names. A single Latin letter regularly suffices: for example,  $a$ ,  $b$  or  $c$ . Let us denote that the object  $a$  and the object  $b$  are the same object by  $a = b$ , read aloud as “a is b.”

For sets, let us tend to use upper case Latin letters: for example,  $A$ ,  $B$ , and  $C$ . To aid our memory, let us tend to use the lower case form of the letter for an element of the set. For example, if  $A$  is a set, let us tend to denote by  $a$  an element of  $A$ . Likewise, if  $B$  is a set, let us tend to denote by  $b$  an element of  $B$ .

Let us denote that an object  $a$  is an element of a set  $A$  by  $a \in A$ . We read the notation  $a \in A$  aloud as “a in A.” The  $\in$  is a stylized lower case Greek letter:  $\epsilon$ . It is read aloud “ehp-sih-lawn” and is a mnemonic for “element of”. We write  $a \notin A$ , read aloud as “a not in A,” if  $a$  is not an element of  $A$ .

If we have named the elements of a set, and can list them, let us do so between braces. For example, let  $a$ ,  $b$ , and  $c$  be three distinct objects. Denote by  $\{a, b, c\}$  the set containing theses three objects and only these three objects. We can further compress notation, and denote this set of three objects by  $A$ : so,  $A = \{a, b, c\}$ . Then  $a \in A$ ,  $b \in A$ , and  $c \in A$ . Moreover, if  $d$  is an object and  $d \in A$ , then  $d = a$  or  $d = b$  or  $d = c$ .

If the elements of a set are so well-known that we can avoid ambiguity, then we can describe the set in English. To aid our memory, let us tend to name such sets mnemonically. For

example, let  $L$  be the set of Latin letters.

Often to be more precise, we should explicitly deal with objects which satisfy several conditions. If the elements of a set satisfy some common condition, then we use the braces and include the condition. For example, let  $V$  be the set of Latin vowels. We can denote  $V$  by  $\{l \in L \mid l \text{ is a vowel}\}$ . We read the symbol  $\mid$  aloud as “such that.” We read the whole notation aloud as “l in L such that l is a vowel.” We call the notation **set-builder notation**. Set-builder notation is indispensable for sets defined implicitly by some condition. Here we could have alternatively denoted  $V$  by  $\{“a”, “e”, “i”, “o”, “u”\}$ . We prefer the former, slightly more concise notation.
