

## Definition

Suppose  $f : \mathbf{R}^n \rightarrow \mathbf{R}$ . Given  $a \in \mathbf{R}^n$  and  $\delta \in \mathbf{R}^n$ , if the limit

$$\lim_{t \rightarrow 0} \frac{f(a + t\delta) - f(a)}{t}$$

exists, then we say that  $f$  is *differentiable at  $a$  in the direction  $x$* . We call the value of the limit the *directional derivative* of  $f$  at  $a$ , in the direction  $\delta$ .

## Notation

We denote the directional derivative of  $f$  at  $a$  by  $D_x f(x)$ .
