

## POLAR COORDINATES

### Why

We identified points in  $\mathbf{R}^2$  with elements of the plane in a natural way.<sup>1</sup>

### Definition

Let  $(x, y) \in \mathbf{R}^2$ . Then  $(r, \theta) \in \mathbf{R}^2$  are polar coordinates of  $(x, y)$  if

$$x = r \cos \theta \quad \text{and} \quad y = r \sin \theta.$$

### Non-uniqueness

A difficulty with polar coordinates is that there are many elements of  $\mathbf{R}^2$  that correspond to the same point in the plane. For example, consider the points

$$(5, \pi/3), (5, -5\pi/3), (-5, 4\pi/3), (-5, -2\pi/3).$$

Each of these specifies the same point in  $\mathbf{R}^2$ .
