

Why**Definition**

Let $(a^1, b^1), \dots, (a^n, b^n)$ be a paired dataset in $A \times B$. An *interpolator* is a predictor $f : A \rightarrow B$ which satisfies

$$f(a^i) = b^i$$

for each $i = 1, \dots, n$. In this case we say that the predictor f *interpolates* the dataset.
