

CHARACTERISTIC FUNCTIONS

Why

We represent rectangles by functions.

Definition

The *characteristic function* of a A of a set X is a function from X to 2 which is 1 if the argument is in A and 0 otherwise.

If the base set is the real numbers and the subset is an interval, then the characteristic function is a rectangle with height one and the width of the interval.

The function which assigns to each subset A of X to characteristic function of A is a one-to-one function from X^* onto 2^X .

Notation

Let A be a non-empty set and $B \subset A$. We denote the characteristic function of B in A by $\chi_B : A \rightarrow R$. The Greek letter χ is a mnemonic for “characteristic”.

The subscript indicates the set on which the function is one. In other words, for all $B \subset A$, $\chi_B^{-1}(\{1\}) = B$.

If B is an interval and α is a real number then $\alpha\chi_B$ is a rectangle with height α .
