

Why

We want to subtract numbers.¹

Definition

Consider the set $\omega \times \omega$. This set is the set of ordered pairs of ω . In other words, the ordered pairs of natural numbers.

We call two such pairs (a, b) and (c, d) of $\omega \times \omega$ *integer equivalent* if

$$a + d = b + c$$

Briefly, the intuition is that (a, b) represents a less b , or in the usual notation “ $a - b$ ”.² So this equivalence relation says these two are the same if $a - b = c - d$. Rearranging gives $a + d = b + c$.

Proposition 1. *Integer equivalence is an equivalence relation.*³

The *set of integer numbers* is the set of equivalence classes (see **Equivalence Relations**) under integer equivalence on $\omega \times \omega$. We call an element an *integer number* (or *integer*).

Notation

We denote the set of integers by **Z**. If we denote integer equivalence by \sim then $\mathbf{Z} = (\omega \times \omega) / \sim$.

¹Future editions will change this why. In particular, by referencing **Inverse Elements** and the lack thereof in ω .

²This account will be expanded in future editions.

³The proof is straightforward. It will be included in future editions.
