

### Why

We want to order two objects.

### Definition

Let  $a$  and  $b$  denote objects. The *ordered pair* of  $a$  and  $b$  is the set  $\{\{a\}, \{a, b\}\}$ . The *first coordinate* of  $\{\{a\}, \{a, b\}\}$  is the object denoted by  $a$  and the *second coordinate* is the object denoted by  $b$ .

### Notation

We denote the ordered pair  $\{\{a\}, \{a, b\}\}$  by  $(a, b)$ .

### Equality

Our intuition of two objects in order dictates that if we have the same objects in the same order then we have the same ordered pair. Conversely, if we have two identical ordered pairs, they must consist of the same objects in the same location. In other words, two ordered pairs should be equal if and only if they consist of the same objects in the same order. Our definition agrees with this intuition. Indeed,

**Proposition 1.**  $((a, b) = (x, y)) \longleftrightarrow (a = x \wedge b = y)$ <sup>1</sup>
