

Definition

A vector is *normalized* if its norm is 1. A set of vectors $\{u_1, \dots, u_k\}$ is *orthogonal* if $u_i^\top u_j = 0$ whenever $i \neq j$. A set of vectors is *orthonormal* if the set is orthogonal and each vector is normalized.

Basis

An orthonormal set of vectors is also an independent set. In other words, orthonormality is stronger than independence.
