

Why

Definition

The *line through* two points in n -dimensional space is the set of points which can be expressed as the sum of the first point and a scaled multiple of the difference between the second point and the first. An *affine set* is a subset of n -dimensional space which contains the lines through each of its points.

Examples

The empty set is trivially an affine set. The entire set of points in n -dimensional space is an affine set. Any singleton is an affine set.

Notation

The *line through* two points x and y in \mathbf{R}^n is the set

$$\{x + a(y - x) \mid a \in \mathbf{R} \text{ and } x, y \in \mathbf{R}^n\}.$$

Notice that the expression $x + a(y - x)$ is equivalent to $(1 - a)x + ay$.

Other Terminology

Some authors call affine sets *affine varieties*, *linear varieties* or *flat*.

Prop. 1. *The intersection of a family of affine sets is affine.*
