
Why

We want to repeatedly multiply.

Defining Result

Proposition 1. *For each natural number m, there exists a function $e_m : \omega \to \omega$ which satisfies*

$$e_m(0) = 1 \quad \textit{and} \quad e_m(n^+) = (e_m(n))^+ \cdot m$$

for every natural number n.

Proof. The proof uses the recursion theorem (see Recursion Theorem).[1] □

Let m and n be natural numbers. The value $p_m(n)$ is the *power* of m with n. Or the *nth power of m*

Notation

We denote the nth power of m by m^n.

Properties

Here are some basic properties of powers.

Proposition 2. *Let k, m, and n be natural numbers. Then*

$$m^n m^k = m^{k+k}.$$

[1]Future editions will give the entire account.

Proposition 3. *Let k, m, and n be natural numbers. Then*

$$(m^n)^k = m^{nk}.$$
