
Why

We can characterize the dependence of two events in terms of the rank of a particular matrix.

Definition

Given a probability measure $\mathsf{P} : \mathcal{P}(\Omega) \to \mathsf{R}$ on the finite set Ω and two events $A, B \subset \Omega$, the *joint probability matrix* of A and B is the matrix

$$M = \begin{bmatrix} \mathsf{P}(A \cap B) & \mathsf{P}(A \cap C_\Omega(B)) \\ \mathsf{P}(C_\Omega(A) \cap B) & \mathsf{P}(C_\Omega(A) \cap C_\Omega(B)) \end{bmatrix}.$$

Characterization of independence

If A and B are independent, then so are A and $C_\Omega(B)$, B and $C_\Omega(A)$, and $C_\Omega(A)$ and$C_\Omega(B)$. In other words,

$$M = \begin{bmatrix} \mathsf{P}(A) \\ \mathsf{P}(C_\Omega(A)) \end{bmatrix} \begin{bmatrix} \mathsf{P}(B) & \mathsf{P}(C_\Omega(B)) \end{bmatrix}.$$

In this case, we see that $\mathsf{rank}(M) = 1$.

Conversely, suppose $\mathsf{rank}(M) = 1$. Then, using the law of total probabiliy, each row is a multiple of

$$M1 = \begin{bmatrix} \mathsf{P}(A) \\ \mathsf{P}(C_\Omega(A)) \end{bmatrix}.$$

In particular, we have $\mathsf{P}(A \cap B) = \alpha \mathsf{P}(A)$ and $\mathsf{P}(C_\Omega(A) \cap B) = \alpha P(C_\Omega(A))$. So

$$\mathsf{P}(A \cap B) + \mathsf{P}(C_\Omega(A) \cap B) = \alpha(\mathsf{P}(B) + \mathsf{P}(C_\Omega(A))),$$

from which we deduce $\alpha = \mathsf{P}(B)$ Likewise, the multiplier for the second column of M is $\mathsf{P}(C_\Omega(B))$. In other words, A and B are independent. We conclude that A and B are independent if and only if $\mathsf{rank}(M) = 1$.
