

INNER PRODUCTS

Why

We abstract the notion of inner product to an arbitrary vector space.

Definition

Suppose **F** is a field which is either **R** or **C**. Let (V, \mathbf{F}) be a vector space. Then a function $f: V \times V \to \mathbf{F}$ is an *inner product* on V if

1.
$$f(x,x) \ge 0$$
, $f(x,x) = 0 \Leftrightarrow x = 0$;

2.
$$f(x,y) = \overline{f(y,x)}$$

3.
$$f(ax + by, z) = a(x, z) + b(y, z)$$

A inner product space (or pre-Hilbert space) is a tuple: a vector space over **R** or **C** and an inner product.
