

### **EVENT PROBABILITIES**

## Why

If we have some outcomes and a probability mass function, we can construct a function which assigns probabilities to events.

#### Definition

The *probability* of an event is the sum of the probabilities of the outcomes in the event. The *event probability function* is the correspondence assigning events to their probabilities.

#### **Notation**

Let A be a set of outcomes and p a probability mass function on A. Let  $B \subset A$  be an event. Let  $\mathbf{P}: 2^A \to R$  be the event probability function:

$$\mathbf{P}(B) = \sum_{b \in B} p(b).$$

Notice that **P** depends on the set of outcomes A and the probability mass function p. Sometimes we will include this when denoting **P** and denote it by  $\mathbf{P}_{A,p}$ .

# **Properties**

PROPOSITION 1. Let P be the event probability function of a probability mass function p on a set of outcomes A. then

1. 
$$\mathbf{P}(B) \geq 0$$
 for all  $B \subset A$ 

- 2. P(A) = 1
- 3.  $\mathbf{P}(B \cup C) = \mathbf{P}(B) + \mathbf{P}(C)$  for  $B, C \subset A$  and  $B \cap C = \emptyset$
