

LINEAR FUNCTIONS

Definition

A function $f: \mathbf{R}^n \to \mathbf{R}$ is linear if

1.
$$f(x+y) = f(x) + f(y)$$
 for all $x, y \in \mathbb{R}^n$ and

2.
$$f(\alpha x) = \alpha f(x)$$
 for all $x \in \mathbb{R}^n$ and $\alpha \in \mathbb{R}$.

There are simple consequences to these conditions. For example, f(0) = 0.
