

## REAL PLANE

## Why

We are constantly thinking of the elements of  ${\bf R}^2$  as points of a plane.<sup>1</sup>

## Discussion

We commonly associate elements of  $\mathbb{R}^2$  with points on a plane. (see Geometry).

**Principle 1** (Line Sets). Given a plane, there exists a set of its (infinite) lines.

**Principle 2** (Real Plane Correspondence). Let L be the set of lines of a plane. Then  $\cup L$  is the set of points of the plane. There exists a one-to-one correspondence mapping elements of  $\cup L$  onto elements of  $\mathbb{R}^2$ .

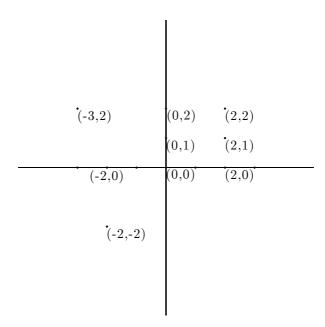

For this reason, we sometimes call elements of  $\mathbb{R}^2$  points. We call the point associated with (0,0) the *origin*. We call the element of  $\mathbb{R}^2$  which corresponds to a point the *coordinates* of the point.

## Visualization

To visualize the correspondence we draw two perpendicular lines. We then associate a point of the line with  $(0,0) \in \mathbb{R}^2$ . We can label it so. We then pick a unit length. And proceed as usual.<sup>2</sup>

<sup>&</sup>lt;sup>2</sup>Future editions will expand this.

Given that we have identified a plane with  $\mathbb{R}^2$  in this way, we call  $(x,y) \in \mathbb{R}^2$  the *coordinates* of the point it corresponds to. Many authors refer to this identification as a *Cartesian coordinate system* (or *Rectangular coordinate system*, x-y coordinate system).
