

## JOINT CUMULATIVE DISTRIBUTION FUNCTIONS

## Why

1

## **Definition**

Let  $X,Y:\Omega\to \mathbf{R}$  be random variables on probability space  $(\Omega,\mathcal{F},\mathbf{P})$ . The joint cumulative distribution function denoted  $F_{X,Y}:\mathbf{R}^2\to [0,1]$  is defined by  $F_{X,Y}(s,t)=\mathbf{P}[X\leq s,Y\leq t]$ .

In general the *joint cdf* for a random vector  $X : \Omega \to \mathbb{R}^n$  is  $F_X : \mathbb{R}^d \to [0,1]$  defined by  $F_X(t) = \mathbb{P}[X \le t]$  where  $x \le t$  means  $x_i \le t_i$  for all i.
