

## RANDOM VARIABLES

## Why

1

## **Definition**

A random variable is a measurable map from a probability space to a measurable space.

A real-valued random variable is a measurable map between the probability space and the set of real numbers with its topological sigma algebra.

## Notation

Let  $(X, \mathcal{A}, \mathbf{P})$  be a probability space. Let  $(Y, \mathcal{B})$  a measurable space. Then a random variable is a measurable function  $f: X \to Y$ .

Some authors denote real-valued random variables by upper case Latin letters: for example, X, Y, Z. In this case, the base probability space is denoted by  $\Omega$ , a mnemonic for "outcomes." Let  $(\Omega, \mathcal{A}, \mathbf{P})$  be a probability space. Let  $X : \Omega \to \mathbf{R}$  be measurable. Then X is a real-valued random variable.

Some authors use notation for the probability of certain common sets. Let  $A \in \mathcal{B}(R)$ . Let  $\mathbf{P}(X \in A)$  denote  $\mathbf{P}(X^{-1}(A))$ . These are equivalent to

$$\mathbf{P}(\{\omega \in \Omega \mid X(\omega) \in A\}).$$

<sup>&</sup>lt;sup>1</sup>Future editions will include this.

Next, let  $Y: \Omega \to R$  a measurable function and let  $B \in \mathcal{B}(R)$ . Similar to the above, let  $\mathbf{P}(X \in A, Y \in B)$  denote  $\mathbf{P}(X^{-1}(A) \cap Y^{-1}(B))$ . These are equivalent to

$$\mathbf{P}(\{\omega \in \Omega \mid X(\omega) \in A \text{ and } Y(\omega) \in B\}).$$
