

INTEGER NUMBERS

Why

We want to do subtraction.¹

Definition

Consider the set $\omega \times \omega$. This set is the set of ordered pairs of ω . In other words, the ordered pairs of natural numbers.

We say that two of these ordered pairs (a, b) and (c, d) is integer equivalent the a + d = b + c. Briefly, the intuition is that (a, b) represents a less b, or in the usual notation "a - b". So this equivalence relation says these two are the same if a - b = c - d or else a + d = b + c.

Proposition 1. Integer equivalence is an equivalence relation.³

We define the set of integer numbers to be the set of equivalence classes (see Equivalence Relations) under integer equivalence on $\omega \times \omega$. We call an element of the set of integer numbers an integer number or an integer. We call the set of integer numbers the set of integers or integers for short.

¹Future editions will change this why. In particular, by referencing Inverse Elements and the lack thereof in ω .

²This account will be expanded in future editions.

³The proof is straightforward. It will be included in future editions.

Notation

We denote the set of integers by ${\bf Z}$. If we denote integer equivalence by \sim then ${\bf Z}=(\omega\times\omega)/\sim$.
