

## AUTONOMOUS CONTINUOUS-TIME LINEAR DYNAMICAL SYSTEMS

## Definition

An autonomous continuous-time linear dynamical system is a matrix  $A \in \mathbb{R}^{n \times n}$ . It models the behavior of a signal  $x : \mathbb{R} \to \mathbb{R}^n$  by

$$\dot{x} = Ax,\tag{1}$$

where  $\dot{x}$  is notation for  $\frac{d}{dt}x(t)$ . A is called the *dynamics matrix*.

A signal x satisfying Equation (1) is called a *solution* or a *trajectory*. For  $t \in \mathbf{R}$ ,  $x(t) \in \mathbf{R}^n$  is called the *state* and  $\mathbf{R}^n$  is called the *state* space. n is called the *state dimension*.
