

MULTIVARIATE REAL DENSITIES

Why

TODO

Definition

A multivariate density or joint density is a function from n-dimensional real space to the real numbers which is nonnegative and and normalized. A real-valued function on n-dimensional real space is normalized if it integrates to 1.

Notation

 $f: \mathbb{R}^d \to \mathbb{R}$ with $f \geq 0$ and $\int f = 1$ is a density.
