

REAL FUNCTION APPROXIMATORS

Why

Since the function space $\mathbf{R} \to \mathbf{R}$ is a vector space, can we approximate a "complex" element of this set by some basis of "simpler" functions in $\mathbf{R} \to \mathbf{R}$.

Of course, there may be no set that can represent f. So instead we may be interested in an element $g \in \text{span}\{g_1, \dots, g_d\}$ which approximates f.¹

Definition

A real function approximator for a function $f: \mathbf{R} \to \mathbf{R}$ is a function $g: \mathbf{R} \to \mathbf{R}$.
