

# Graphs

### 1 Why

We want to visualize relations.

#### 2 Definition

A graph is a set and a relation on the set. The graph is undirected if the relation is symmetric; otherwise the graph is directed.

A vertex of the graph is an element of the set. The set is called the vertex set. An edge of the graph is an element of the relation. The relation is called the edge set.

If the graph is directed, we call the first element of an edge the *parent* of the second element. We call the second element of an edge the *child* of the first element. So we can discuss the set of parents or set of children of a particular vertex (these sets may be empty).

#### 2.1 Notation

We denote the vertex set by V, a mnemonic for vertex. We denote the edge set by E, a mnemonic for edge. We denote a graph by (V, E). If the vertex set is assumed, or if every vertex appears in E we can unambiguously refer to the graph by E.

## 2.2 Visualization

We visualize a graph by drawing a point for each vertex. If two vertices u and v are in relation, we draw a line from the point corresponding to u to the point corresponding to v with an arrow at the point corresponding to v. If the graph is undirected, we omit arrows. Here are all undirected graphs on three vertices.

#### 3 Paths

A path in a graph is a sequence of vertices with the property that consecutive vertices are related. A path cycles if a vertex appears more than once. A path is finite if the sequence is finite. A loop is a finite path that cycles once. A finite path from vertex u to vertex v is a path starting with u and ending with v. The length of a finite path is the length of the sequence.

## 4 Properties

A graph is *connected* if there is a path between every pair of vertices. A graph is *acyclic* if none of its paths cycle.
