

OPERATIONS

Why

We want to "combine" elements of a set.

Definition

Let A be a non-empty set. An *operation* on A is a function from ordered pairs of elements of the set to the same set. Operations to *combine* elements. We *operate* on ordered pairs.

Notation

Let A be a set and $g: A \times A \to A$. We tend to forego the notation g(a,b) and write a g b instead. We call this *infix notation*.

Using lower case latin letters for elements and for operators confuses, so we tend to use special symbols for operations. For example, +, -, \cdot , \circ , and \star .

Let A be a non-empty set and $+: A \times A \to A$ be an operation on A. According to the above paragraph, we tend to write a + b for the result of applying + to (a, b).
