

## Symmetric Matrices

## 0.1 Why

Matrices that have reflected values across their diagonals arise often.

## 0.2 Definition

A square matrix is *symmetric* if its values do not depend on the order of the indices. In other words, a matrix is symmetric if the value above and below the diagonal are a mirror image.

## 0.3 Notation

Let  $A \in \mathbb{R}^{n \times n}$  Then A is symmetric if  $A_{ij} = A_{ji}$ . We denote the set of real-valued n by n symmetric matrices by  $\mathbb{S}^n$ .
