

## Conditional Event Probability

## 1 Why

## 2 Definition

Consider two events, the second of which has non-zero probability. The *conditional probability* of the first event *conditioned* on a second event is the result of dividing the probability of the second event into the probability of the intersection of the two events.

## 2.1 Notation

Let **P** be the event probability function. Let A and B be two events with  $\mathbf{P}(B) \neq 0$ . Then the conditional probability of A conditioned on B is

$$\frac{\mathbf{P}(A \cap B)}{\mathbf{P}(B)}$$
.

We denote this by  $P(A \mid B)$ .
