

MATRICES AND LINEAR TRANSFORMATIONS

Why

All linear transformations are equivalent to multiplication by a matrix.

Main Result

Prop. 1. Let $(V_1, \mathsf{F}), (V_2, \mathsf{F})$ be two vector spaces and $f: V_1 \to V_2$ be a transformation between them.

If f is linear, then there exists bases for the spaces and a matrix A in F for which matrix multiplication is equivalent to applying f.

If A is a matrix in F f is linear if and only if there exists a matrix in F whose coordinates in V_1 to coordinates in V_2 .
