

## **REAL FUNCTIONS**

# Why

We name functions whose domain is the real numbers.

### **Definition**

A real function is a real-valued function. The domain is often an interval of real numbers, but may be any non-empty set.

#### Notation

Let A be a set. Let  $f: A \to R$ . f is a real function. If  $A = \mathbb{R}$ , then  $f \in \mathbb{R} \to \mathbb{R}$ . To speak of functions defined on intervals, let  $a, b \in \mathbb{R}$ . Let  $g: [a, b] \to \mathbb{R}$ . Then g is a real function defined on a closed interval. Let  $h: (a, b) \to \mathbb{R}$ . Then h is a real function defined on an open interval.

We regularly declare the interval and the function at once. For example, "let  $f:[a,b]\to \mathbb{R}$ " is understood to mean "let a and b be real numbers with a< b, let [a,b] be the closed interval with them as endpoints, and let f be real-valued function whose domain is this interval". We read teh notation  $f:[a,b]\to \mathbb{R}$  aloud as "f from closed a b to  $\mathbb{R}$ ." We use  $f:(a,b)\to \mathbb{R}$  similarly (read aloud "f from open a b to  $\mathbb{R}$ ").

# **Examples**

**Example 1.** Let  $c \in \mathbb{R}$ . Let  $f : \mathbb{R} \to \mathbb{R}$  be such that f(x) = c for every  $x \in \mathbb{R}$ . f is a real function.

# Example 2.

Let  $f : \mathbb{R} \to \mathbb{R}$  with  $f(x) = 2x^2 + 1$  for all  $x \in \mathbb{R}$ . f is a real function.

Example 3. Let  $f : R \to R$  with

$$f(x) = \begin{cases} 1 & \text{if } x \in \mathbf{Q} \\ 0 & \text{otherwise.} \end{cases}$$

f is a real function.
