

## DIRECTED GRAPHS

## Why

We want to visualize relations.

## Definition

An directed graph is a finite nonempty set and a set of ordered pair its elements with distinct coordinates. We call the elements of the first set the vertices of the graph and the elements of the second set the edges. We say an edge is from its first coordinate to its second coordinate.

We say that an edge is *incident* to its first and second coordinate. We call the first coordinate a *parent* of the second; and we call and the second coordinate a *child* of the first. The *child set* of a vertex is the set of its child vertices and similarly for the *parent set*; we refer to these sets as the *children* and *parents* of the vertex, respectively. A directed graph is *complete* if every vertex is both a child and parent of every other vertex.
