

Row Reducer Matrices

Why

Can we represent the function associating a linear system with its row reduction by matrix multiplication?

Main observation

The following proposition affirmatively answers the question.

Proposition 1. Let $(A \in \mathbf{R}^{m \times m}, b \in \mathbf{R}^m)$ be a linear system with $A_{kk} \neq 0$ and (C, d) the kth reduction of (A, b). Then there exists a matrix $L \in \mathbf{R}^{m \times m}$ so that C = LA and d = Lb.

Proof. Define $L \in \mathbf{R}^{m \times m}$ by $L_{st} = 1$ if $s = t, -A_{sj}/A_{ij}$ if $k < s \le m$ and zero otherwise.

For this reason, we call L in the above proposition a row reducer matrix or row reducing matrix or row reducer. The row reducer matrix for the kth reduction of (A, b) has the form

$$L_k = \begin{bmatrix} 1 & & & & & & \\ & \ddots & & & & & \\ & & 1 & & & & \\ & & A_{ik}/A_{kk} & 1 & & & \\ & & \vdots & & \ddots & & \\ & & & A_{mk}/A_{kk} & & 1 & \end{bmatrix}$$

So the following is immediate

Proposition 2. Row reducing matrices are unit lower triangular.

Example

For example, the (1,1)-reduction of (A,b) in which

$$A = \begin{bmatrix} 2 & 1 & 1 & 0 \\ 4 & 3 & 3 & 1 \\ 6 & 7 & 9 & 5 \\ 8 & 7 & 9 & 8 \end{bmatrix} \text{ and } b = \begin{bmatrix} 1 \\ 2 \\ 3 \\ 4 \end{bmatrix}.$$

is the linear system

$$A' = \begin{bmatrix} 2 & 1 & 1 & 0 \\ 0 & 1 & 1 & 1 \\ 0 & 3 & 5 & 5 \\ 0 & 4 & 6 & 8 \end{bmatrix} \text{ and } b' = \begin{bmatrix} 1 \\ 0 \\ -1 \\ 1 \end{bmatrix}.$$

The row reducer is $L \in \mathbb{R}^{4 \times 4}$ defined by

$$L = \begin{bmatrix} 1 & 0 & 0 & 0 \\ -2 & 1 & 0 & 0 \\ -4 & 0 & 1 & 0 \\ -3 & 0 & 0 & 1 \end{bmatrix}.$$

One can check that A' = LA and b' = Lb, and clearly L is unit lower triangular.
