

## REAL VECTORS

## Why

A point in  $\mathbb{R}^n$  is also called a vector in  $\mathbb{R}^n$ , since  $\mathbb{R}^n$  with the usual operations of element-wise addition and element-wise scalar multiplication is a vector space.

## Result

For  $x, y \in \mathbb{R}^n$ , define x + y by

$$(x_1+y_1,\ldots,x_n+y_n)$$

and for  $\alpha \in \mathbf{R}$ , define  $\alpha \cdot x$ 

$$(\alpha x_1,\ldots,\alpha x_n).$$

**Proposition 1.**  $\mathbb{R}^n$  is a vector space of dimension n over  $\mathbb{R}$  with + and  $\cdot$ .

For this reason, we call elements of  $\mathbb{R}^n$  (real) vectors.
