

MAXIMUM LIKELIHOOD

Why

We provide a principle for distribution selection based on maximizing the probability of the dataset.

Definition

We have a set of outcomes A and a dataset (a^1, \ldots, a^n) . We want a distribution $p: A \to \mathbb{R}$. We define $\bar{p}: A^n \to \mathbb{R}$ by $\bar{p}(a^1, \ldots, a^n) = \prod_{i=1}^n p(a^i)$.

The principle of maximum likelihood says to solve:

find p, a distribution to maximize $\bar{p}(a^1, \dots, a^n)$
