

ORTHOGONAL MATRICES

Definition

An *orthonormal* (or *orthogonal*) matrix is a matrix whose columns are an orthonormal family of vectors.

Some authors call these $real\ orthogonal\ or\ unitary\ matrices.$

Notation

Let $A \in \mathbf{F}^{m \times n}$. Something something

$$AA^{\top} = I.$$

Characterizations

Proposition 1. A matrix is orthonormal if and only if its transpose product with the matrix is the identity.

Proposition 2. A matrix is orthonormal if and only if its transpose is orthonormal.
