

## SUBSET SYSTEMS

## Why

We are often interested in a set of subsets of a given set.

## **Definition**

Let A be a non-empty set. A *subset system* is a pair  $(A, \mathcal{A})$  in which  $\mathcal{A} \subset \mathcal{P}(A)$ . In this common case we call the first set the *base set* and the second set the *distinguished subsets*. A subset of  $B \subset A$  which is not distinguished (i.e.,  $B \notin \mathcal{A}$ ) is called *undistinguished*.

**Example 1.** Let A be a nonempty set. Let A be P(A). Then (A, A) is a subset system.
