

## MINIMUM MEAN SQUARED ERROR ESTIMATES

## Why

What is the best estimate for a random variable if we consider the square error?

## Definition

Let  $(\Omega, \mathcal{A}, \mathbf{P})$  be a probability space and  $x : \Omega \to \mathbf{R}$  a random variable. A minimum mean squared error estimate or MMSE estimate or least square estimate is a value  $\xi \in \mathbf{R}$  which minimizes  $\mathbf{E}(x - \xi)^2$ .

**Proposition 1.** There is a unique MMSE estimate and it is given by  $\mathbf{E}(x)$ .

## **Vector Case**

Let  $(\Omega, \mathcal{A}, \mathbf{P})$  be a probability space and  $y : \Omega \to \mathbf{R}^n$  a random variable.

A minimum mean squared error estimator or MMSE estimator or least square estimator is a value  $\xi \in \mathbf{R}$  which minimizes  $\mathbf{E} ||x - \xi||^2$ .

**Proposition 2.** There is a unique MMSE estimator and it is given by  $\mathsf{E}(y)$ .
