

## LINE SEGMENTS

## Why

1

## Definition

The closed line segment between two points in n-dimensional space is the set of points which can be expressed as the sum of the first point and a scalar multiple of the difference between the second point and the first; where the scalar is in the interval [0,1]. Thus, the closed line segment between two points is a subset of the line though the two points. The open line segment between x and y is the closed line segment with the points x and y.
