

## GENERATED SIGMA ALGEBRA

## Why

A simple way to obtain a sigma algebra, is to ask it to obtain some sets, and then to ask it to contain all the sets it needs to fulfill the properties.

## **Definition**

The generated sigma algebra for a set of subsets is the smallest sigma algebra containing the set of subsets. We must prove the existence and uniqueness of this sigma algebra.

Proposition 1. The intersection of a non-empty set of sigma algebras on the same base set is a sigma algebra.

*Proof.* Let  $\{(A, \mathcal{A}_{\alpha}\}_{{\alpha} \in I} \text{ a familiy of sigma algebras on the same base set. Define <math>\mathcal{A}$  as  $\cap_{{\alpha} \in I} \mathcal{A}_{\alpha}$ .

- 1. For all  $\alpha \in I$ ,  $A \in \mathcal{A}_{\alpha}$ , thus  $A \in \mathcal{A}$ ; condition (a).
- 2. For all  $B \in \mathcal{A}$ , for all  $\alpha \in I$ ,  $B \in \mathcal{A}_{\alpha}$ . Thus, for all  $\alpha \in I$ ,  $C_A(B) \in \mathcal{A}_{\alpha}$ . And so  $C_A(B) \in \mathcal{A}$ ; condition (b).
- 3. For all sequences  $\{B_n\} \subset \mathcal{A}$ ,  $\{B_n\} \subset \mathcal{A}_{\alpha}$  for all  $\alpha$ . Thus  $\cup_n B_n \in \mathcal{A}_{\alpha}$  for all  $\alpha$  and so  $\cup_n B_n \in \mathcal{A}$ ; condition (c).

On the other hand, the union of a set of sigma algebras can fail to be a sigma algebra.

PROPOSITION 2. If A is a set and  $A \subset 2^A$ , then there is a unique a smallest sigma algebra containing A.

*Proof.* We know of one sigma algebra containing  $\mathcal{A}$ : the power set of A. Thus, the set of sigma algebras containing  $\mathcal{A}$  is not empty. Proposition 1 implies the intersection of all such sigma algebras (containing  $\mathcal{A}$ ) is a sigma algebra. The intersection contains  $\mathcal{A}$ , and is contained in all other sigma algebras with this property, so is a smallest sigma algebra containing  $\mathcal{A}$ . If  $\mathcal{B}, \mathcal{C}$  were two smallest sigma algebras, then  $\mathcal{B} \subset \mathcal{C}$  and  $\mathcal{C} \subset \mathcal{B}$ , but then  $\mathcal{B} = \mathcal{C}$ ; thus the smallest sigma algebra is unique.  $\square$ 

## **Notation**

Let A be a set and  $A \subset 2^A$ . We denote the sigma algebra generated by A by  $\sigma(A)$ .
