

## Why

If A and B are two events in some finite sample space  $\Omega$  and P is the event probability function of some distribution, we have seen that

$$P(A \cup B) = P(A) + P(B) - P(A \cap B)$$

What if we have three events A, B, C? What of a list of n events  $A_1, \ldots, A_n$ ?

Case of n=3.

**Proposition 1.** Suppose A, B, C are events in a finite sample space and P is any event probability function. Then

$$P(A \cup B \cup C) = P(A) + P(B) + P(C)$$
$$-P(A \cap B) - P(A \cap C) - P(B \cap C)$$
$$+P(A \cap B \cap C)$$

Proof. Express

$$P(A \cup B \cup C) = P(A \cup B) + P(C) - P((A \cup B) \cap C)$$
  
=  $P(A) + P(B) + P(C) - P(A \cap B) - P((A \cup B) \cap C)$ 

by using the inclusion-exclusion formula. Recall<sup>1</sup> that

$$(A \cup B) \cap C = (A \cap C) \cup (B \cap C)$$

Now use the inclusion-exclusion formula again, and properties of set pair intersections to get

$$P((A \cup B) \cap C) = P(A \cap C) + P(B \cap C) - P((A \cap C) \cap (B \cap C))$$
$$= P(A \cap C) + P(B \cap C) - P(A \cap B \cap C)$$

<sup>&</sup>lt;sup>1</sup>See Set Unions and Intersections.

## Case of n.

**Proposition 2.** Suppose  $A_1, \ldots, A_n$ , are events in a finite sample space and P is any event probability function. Then

$$P(A_1 \cup \dots \cup A_n) = \sum P(A_i) - \sum P(A_i \cap A_j)$$
$$\sum P(A_i \cap A_j \cap A_k) - \dots$$
$$(-1)^{n-1} P(A_1 \cap \dots \cap A_n)$$

*Proof.* This can be shown by induction on the number of events n. Future editions will include.

Here there are  $\binom{n}{r}$  terms in the rth sum,  $r = 1, \ldots, n$ .
