

#### COMPLEX ARITHMETIC

## Why

We want to add and multiply complex numbers.<sup>1</sup>

### **Definition**

Let  $z_1, z_2 \in \mathbf{C}$  with  $z_1 = (x_1, y_1)$  and  $z_2 = (x_2, y_2)$ . The complex product of  $z_1$  and  $z_2$  is the complex number  $(x_1x_2 - y_1y_2, x_1y_2 + y_1x_2)$ .

# **Properties**

**Proposition 1** (Distributivity). For all  $z_1, z_2, z_3 \in \mathbb{C}$ , we have  $z_1(z_2+z_3)$  and  $z_1z_2 + z_1z_3$ 

#### Relaton to R<sup>2</sup>

Addition in C corresponds to the usual addition of the corresponding vectors in the plane  $R^2$ . In other words, it corresponds to element-wise addition. However multiplication in C is *not* componentwise multiplication in  $R^2$ .

 $<sup>^{1}\</sup>mathrm{Future}$  editions will expand in the genetic account for introducing complex numbers.
