

CONVEX FUNCTIONS

Why

We generalize convex functions to arbitrary vector spaces.

Definition

Suppose (X, \mathbf{R}) is a real vector space. Then $f: X \to \mathbf{R}$ is *convex* if

$$f(tx + (1-t)y) \le tf(x) + (1-t)f(y)$$

for all $t \in [0,1]$ and $x, y \in X$.

Example

Any norm is a convex function.
