

## Definition

A continuous-time time-invariant linear dynamical system is a tuple (A, B, C, D) where  $A \in \mathbb{R}^{n \times n}$ ,  $B \in \mathbb{R}^{n \times m}$ ,  $C \in \mathbb{R}^{k \times n}$  and  $D \in \mathbb{R}^{k \times m}$ . Given an input  $u : \mathbb{R} \to \mathbb{R}^m$ , it models a state  $x : \mathbb{R} \to \mathbb{R}^n$  and output  $y : \mathbb{R} \to \mathbb{R}^k$  by

$$\dot{x} = Ax + Bu,$$
  
$$y = Cx + Du.$$

Here Ax is called the *drift term* and Bu is called the input term (of  $\dot{x}$ ).
