

## MONOTONE REAL FUNCTIONS

## Why

We can interpret a real function as tracing a path as we move from left to right in its domain.<sup>1</sup> We want language for whether this tracing increases or decreases the range values.

## Definition

Let  $A \subset \mathbf{R}$  and let  $f: A \to \mathbf{R}$ . A function is monotone increasing if f(x) < f(y) whenever x < y, and monotone nondecreasing if  $f(x) \leq f(y)$  whenever  $x, y \in \mathbf{R}$  and x < y. Similarly we define monotone decreasing and monotone nonincreasing.

 $<sup>^1{\</sup>rm Future}$  editions will likely have this interpretation in a separate sheet.

<sup>&</sup>lt;sup>2</sup>Unforunately, some authors use "monotone increasing" for "monotone nondecreasing" and use the terminolgy *strictly monotone increasing* for "monotone increasing".
