

# Sequences

## 1 Why

We introduce language for the steps of an infinite process.

#### 2 Definition

Let A be a non-empty set. A sequence in A is a function from the natural numbers to the set. The nth term of a sequence is the result of the nth natural number; it is an element of the set.

#### 2.1 Notation

Let A be a non-empty set.  $a : \mathbf{N} \to A$ . is a sequence in A. a(n) is the nth term. We also denote a by  $(a_n)_n$  and a(n) by  $a_n$ .

## 3 Subsequences

A *subindex* is a monotonically increasing function from and to the natural numbers. Roughly, it selects some ordered infinite subset of natural numbers. A *subsequence* of a first sequence is any second sequence which is the composition of the first sequence with a subindex.

### 4 Notation

Let  $i: N \to N$  such that  $n < m \implies i(n) < i(m)$ . Then i is a subindex. Let  $b = a \circ i$ . Then b is a subsequence of a. We denote it by  $\{b_{i(n)}\}_n$  and the nth term by  $b_{i(n)}$ .

TODO: integrate, from direct products

If I is the set of natural numbers we denote the direct product by

$$\prod_{i=1}^{\infty} A_i.$$

We denote an element of  $\prod_{i=1}^{\infty} A_i$  by  $(a_i)$  with the understanding that  $a_i \in A_i$  for all  $i = 1, 2, 3, \ldots$ . If  $A_i = A$  for all  $i = 1, 2, 3, \ldots$ , then  $(a_i)$  is a sequence in A.
