

Tree-Structured Distribution Approximation

1 Why

2 Problem Statement

Tree-structured distribution approximation is a mathematical optimization problem in which we find a tree-structured distribution which minimizes its entropy relative to a given distribution over the set of all distributions which factor according to trees.

2.1 Notation

Let A_1, \ldots, A_n be non-empty sets. Let q be a distribution on $\prod_{i=1}^n A_i$. Let d denote the relative entropy.

We want to find a distribution p on A and tree T on $\{1,\ldots,n\}$ to

minimize d(q, p)subject to p factors according to the tree T
