

#### SUBSET SYSTEMS

## Why

We speak of a *set* and a subset of its power set which satisfies certain properties. The utility of this abstract concept is proved by its examples, in future sheets.

### **Definition**

A *subset system* is a pair of sets: the second set contains subsets of the first.

We call the first setset the base set. We call elements of the second set distinguished subsets. An undistinguished subset is a subset of the first set which is not distinguished.

#### **Notation**

Let A be a set and  $A \subset A^*$ . We denote the subset system of A and A by (A, A), read aloud as "A, script A."

# Example

**Example 1.** Let A be a nonempty set. Let A be  $A^*$ . Then (A, A) is a subset system.
